

API

BlueSky(Hard)

<https://docs.bsky.app/>

这个主要是通过登陆我的账号然后开始访问数据的

HANDLE = "andystudent.bsky.social"

PASSWORD = "Andrew2026"

这些就是我账号的密码，别去干奇怪的事情啊

需要 pip install atproto

Code block

```
1  from atproto import Client
2
3  HANDLE = "andystudent.bsky.social"
4  PASSWORD = "Andrew2026"
5
6  print("1. create client")
7  client = Client()
8
9  print("2. login start")
10 client.login(HANDLE, PASSWORD)
11 print("3. login success")
12
13 result = client.app.bsky.feed.search_posts({
14     "q": "Australia",
15     "limit": 10
16 })
17
18 print("Posts:", len(result.posts))
19
20 for post in result.posts:
21     print("Author:", post.author.handle)
22     print("Time:", post.record.created_at)
23     print("Text:", post.record.text)
24     print("-" * 40)
```

也可以用request

GDELT

GDELT（全球事件、语言与语调数据库）是一个开源的全球新闻数据平台，用于实时监测和分析来自世界各地的新闻媒体。它会自动收集新闻内容，并通过自然语言处理技术提取结构化信息，例如事件类型、发生地点、涉及人物以及情绪倾向（正面或负面）。GDELT 并不提供完整的**新闻正文**，而是提供经过处理的元数据和趋势分析结果（如新闻数量变化和情绪变化），因此非常适合用于宏观层面的全球事件和舆论变化分析。（真的只是检测平台啊

<https://www.gdeltproject.org/data.html>

GDELT的API不需要申请，在此列举使用方法。

GDELT有5秒限制（每次申请必须间隔5秒）

Code block

```
1  import time
2  import requests
3
4  url = "https://api.gdeltproject.org/api/v2/doc/doc"
5
6  # 请求数据类型
7  params = {
8      "query": "Australia", #搜索关键词
9      "mode": "ArtList", # 文章列表
10     # "mode": "TimelineVol" #时间顺序变化
11     # "mode": "TimelineTone" # 情绪变化 (sentiment)
12     "format": "json",
13     "maxrecords": 10
14 }
15 # 加上这些params之后，我们的请求就会变成
16 # https://api.gdeltproject.org/api/v2/doc/doc?
17 # query=Australia&mode=ArtList&format=json&maxrecords=10
18 # 格式的感觉
19
20 headers = {
21     "User-Agent": "Mozilla/5.0" #访问客户端，不写可能会被拒绝
22 }
23
24 while True:
25     res = requests.get(url, params=params, headers=headers)
26
27     print("Status:", res.status_code)
28
29     if res.status_code == 200:
30         data = res.json()
```

```

30         for article in data.get("articles", []):
31             print(article.get("title")) #先这么写看看有没有成功
32     else:
33         print("Error:", res.text)
34
35     time.sleep(5) #5秒等待

```

数据格式（不知道为什么搜索出这么个神秘的玩意）

Code block

```

1  // Artlist结构
2  {
3      'url': 'https://www.huxiu.com/article/4849251.html',
4      'title': '一国吸十三国，这个国家永远不缺人 - 虎嗅网',
5      'seendate': '20260409T144500Z',
6      'domain': 'huxiu.com',
7      'language': 'Chinese',
8      'sourcecountry': 'China'
9  }

```

Mastodon API

Mastodon 是一个去中心化的社交媒体平台，由多个独立的服务器（instances）组成。每个服务器都有自己的用户和数据，因此其 API 只能访问特定服务器上的内容，而不是整个网络。这种架构使得数据更加分散，虽然适合分析特定社区（例如澳大利亚相关服务器）的讨论，但在数据完整性和规模上存在一定局限。

Mastodon API 是基于 HTTP 的 REST API，需要通过应用注册和 access token 进行认证来访问用户或服务器数据。

所以在此我选择在<https://aus.social> 上创建账号（

<https://docs.joinmastodon.org/client/intro/>

Code block

```

1  import requests
2
3  url = "https://aus.social/api/v1/timelines/public"
4  ACCESS_TOKEN = "w3amrwWgbXqPVyRBl9eB32ZxijnzZLNNsVAyvRgw9Hg"
5

```

```

6  headers = {
7      "Authorization": f"Bearer {ACCESS_TOKEN}"
8  }
9
10 res = requests.get(url, headers=headers)
11
12 data = res.json()
13
14 for post in data[:5]:
15     print(post["content"])

```

json样式

Code block

```

1  {
2      "posts": [
3          {
4              "text": "\"Over those 7 years AI systems have grown exponentially. The
size of the models (parameter count) has grown by 4,000x and the number of
times they are run in each task (tokens generated) has grown by about
100,000x\"",
5              "links": [

Reddit

链接: <https://www.reddit.com/r/reddit.com/wiki/api/>

数据使用规范: <https://redditinc.com/policies/data-api-terms>

要创建账号, 完成2-Authen, 然后应该是在 <https://www.reddit.com/prefs/apps>里面Create APP

然后, 然后我们家的网络IP就被Reddit封了。WTF?
